The Ogden ETR-9200 provides increased safety and enhanced performance in the E-Z Flow system. It will hold heat and prevent overheating better than the previous controllers.

E-Z Flow's factory temperature settings are 135º F. for the "A" controller, and 155º F. for the "B" controller. Maximum setting for either side is 170º F.

If it is necessary to change the temperature settings, it can be done as follows:

1. Turn unit on, and wait approx. 15 seconds for the display to stabilize. This is necessary each time the unit starts, to allow the Ogden unit to access its internal memory. The temperature setting (in degrees F) will be the green numeric display.

2. Touch the middle button below the display (indicated by the double "up" arrow). The right digit should now be brighter than the others.

3. To change this digit, press and HOLD the "up" (middle) or "down" (right) button. When the digit reaches the desired number, release the button.

4. To select another digit, touch the "up" or "down" button, and another digit will be indicated. This digit can be changed as noted above.

5. When desired setting is displayed, wait approx. 15 seconds, and the display will return to normal. The desired setting will now be programmed, and will stay in the unit's memory.

NOTE: There is no need to use the left button (indicated by an oval with an arrow) for resetting temperature. This will change the parameter displayed. If this button is touched inadvertently, wait approx. 30 seconds, and the display will reset.
